BCD REGULATES THE EXPRESSION OF ZYGOTIC GENES, POSSIBLY THROUGH ITS HOMEODOMAIN, AND INHIBITS THE ACTIVITY OF OTHER MATERNAL GENE PRODUCTS. IT IS POSSIBLE THAT BCD ALSO BINDS RNA.

                                                                                                                                                                                                     Gaps
The peptide can be used for treating inflammation and immunemediated tissue damage such as occurs in the course of autoimmune diseases, e.g. rheumatoid arthritis. It can also be used for determining metastatic potential or to treat or prevent tumor cell metastasis. This peptide corresponds to AA 110-131 of the CD44 protein sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The peptide can be used for treating inflammation and immune-mediated tissue damage such as occurs in the course of autoimmune diseases, e.g. rheumatoid arthritis. It can also be used for determining metastatic potential or to treat or prevent tumor cell metastasis. This peptide corresponds to AA 107-117 of the CD44

                                                 from specific signal transduction pathways. The peptide inhibition is probably the result of competition between the phosphorylated peptide and the phosphorylated receptor for the same binding site on the SH2 domains. The inventors claim the peptides can be used for the control of several proliferative diseases, eg. cancer.
The peptide inhibits the association of a tyrosine kinase with its cellular substrates and effectively uncouples the tyrosine kinase

The peptide inhibits the association of a tyrosine kinase with its cellular substrates and effectively uncouples the tyrosine kinase from specific signal transduction pathways. The peptide inhibition is probably the result of competition between the phosphorylated peptide and the phosphorylated receptor for the same binding site on the SH2 domains. The inventors claim the peptides can be used for the control of several proliferative diseases,eg. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                       New peptide(s) with a tyrosine auto-phosphorylation site -
inhibit tyrosine kinase association with regulatory proteins,
used for treating, e.g., hyper-proliferative, viral, allergic
inflammatory, auto-immune and cardiovascular diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cellular substrates and effectively uncouples the tyrosine kinase from specific signal transduction pathways. The peptide inhibition is probably the result of competition between the phosphorylated peptide and the phosphorylated receptor for the same binding site on the SH2 domains. The inventors claim the peptides can be used for the control of several proliferative diseases, eg. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The peptide inhibits the association of a tyrosine kinase with its

                                                                                                                                                                                                                                                                                                                                                                                                                                                    The peptide inhibits the association of a tyrosine kinase with its cellular substrates and effectively uncouples the tyrosine kinase from specific signal transduction pathways. The peptide inhibition is probably the result of competition between the phosphorylated peptide and the phosphorylated receptor for the same binding site on the SH2 domains. The inventors claim the peptides can be used for the control of several proliferative diseases, eg. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                nical assay; quality control; immunohistochemical stain; viral infection.

class I histocompatibility antigen and/or phosphoglycerate kinase. These nucleic acid single nucleotide polymorphisms (SNPs) and the encoded proteins have potential immunosuppressive, immunostimulatory, antisclerotic, antidiabetic, antiinflammatory, cytostatic, antisclerotic, and antimicrobial activity and may be useful in gene/protein therapy, vaccines, modulation of the expression and activity of proteins related to anglopoietin, 4-hydroxybutyrate, dehydrogenase, adenosine triphosphate (ATP)-dependent RNA helicase, major histocompatibility complex (MHC) Class I histocompatibility antigen and/or phosphoglycerate Kinase. Disorders that may be prevented, diagnosed and/or treated by the above methods include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lupus crythenatosus and Grave's disease), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, leukemia), diseases of the nervous system, an infection of pathogenic organisms. They may also be used to alter phenotypic traits such as longevity, appearance,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .;

altered ability to oligomerise) compared to wild-type mature human insulin (AAB48848, AB48849) but which are still capable of binding to an insulin receptor. The insulin mutants of the invention have less than 98% sequence identity to wild-type human insulin, but have a 3D structure which substantially corresponds to that of wild-type human insulin. The invention also relates to recombinant nucleic acids encoding the insulin mutants, expression vectors and host cells comprising mutant insulin mutants, expression vectors and host cells comprising mutant can da pharmaceutical composition comprising an insulin mutant of the invention. The mature human insulin mutants are useful for treating these insulin mutants are used in gene therapy techniques for treating these conditions. The insulin mutants are more stable compared to wild-type mature human insulin, or have an improved ability to form insulin have improved stability.
                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to a method for the production of a subunit peptide originating from a polymer protein with disulphide bonds within and between subunits. The method comprises denaturing the protein or its subunit using a protein denaturing agent in a solution, removing the agent in the presence of a polyoxyalkyl polyether which reacts with a thiol group and unwinds the subunit, and separating the polyoxyalkyl polyether-bound subunit peptide. The method can be used for producing
                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Producing physiologically-active subunit peptides originating in polymer proteins by denaturation and specific separation, with lower antigenicity but improved solubility and stability, e.g. blood

physiologically-active subunit peptides for polymer proteins e.g. snake venom-originated dimer peptide with blood platelet-inhibitory activity on von Willebrand's factor. The peptides produced have platelet-binding inhibitory, and thrombolytic activity. The present sequence represents a fragment of a rattleenake protein used in an example illustrating the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Kinase alpha D region comprising 5-30 amino acids, which modulates kinase alpha D region comprising 5-30 amino acids, which modulates the activity of the protein kinase. AAY98286 to AAY98455 represent peptides derived from protein kinase alpha D regions, which are used in the exemplification of the present invention. The peptides have cytostatic, anti-diabetic, ancectic, antiinflammatory, dermatological, cardiant, immunosuppressive, immunomodulator, osteopathic, vasotropic and antiarteriosclerotic activities, and are protein kinase modulators. The peptides can be used as test peptides to identify protein kinase The peptides can a subject, and in a method of detecting a ligand that binds to the alpha D region of a protein kinase. They may be used to protein kinase. They may be used to protein kinase. They may be used to protein kinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Alpha D peptide; Alpha D region; protein kinase; modulation; activity; cytostatic; anti-diabetic; anorectic; antiinflammatory; dermatological; immunosuppressive; immunomodulator; osteopathic; cardiant; vasotropic; antiarteriosclerotic; protein kinase modulator; cancer; proliferation; restenosis; atherosclerosis; skin disorder; diabetes; obesity; central nervous system disorder; inflammatory disorder; osteoporosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptide derivatives of protein kinase alpha D regions which selectively modulate the activity of protein kinases {\ \ }

The present peptide is derived from a Sp17 protein. Sp17 peptides contain antigenic epitopes in mice, rabbits, non-human primates and humans. They induce antibodies which recognies sperm, and inhibit fertilisation. The peptides can be used in immunocontraceptive methods as a fimunocontraceptive vaccine to reduce the fertility of animals, particularly in females. The presence of the antigenic peptides can be detected to diagnose autoimmune fertility in both male and female
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (a) an antigen; (b) an immunostimulating substance consisting of neuroactive compounds, hormones, compounds having growth hormone activity or their mixtures; and (c) a polycationic polymer. The present sequence is an antigenic peptide derived from Hepatitis c virus, which was used in the present invention. The composition is useful in manufacturing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AAJ00010-AAJ04121. These are derived from HCV HLA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A.Residues: 1-26 <DE2>
A.Experimental source: kidney
C.Comment: This enzyme is a membrane bound protein.
C.Comment: This enzyme hydrolyzes imido bonds.
C.Comment: This emzyme acts as an aminoacylproline hydrolase and is a member of the prol
C.Superfamily: pig X-Pro aminopeptidase
C.Superfamily: pig X-Pro aminoacylpeptide hydrolase; membrane protein

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
The peptide can be used for treating inflammation and immune-mediated tissue damage such as occurs in the course of autoimmune diseases, e.g. rheumatoid arthritis. It can also be used for determining metastatic potential or to treat or prevent tumor cell metastasis. This peptide corresponds to AA 150-161, 170-177 and 189-180 of the CD44
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Use of CD44 protein and new peptide derivs - for developing prods for inflammation, immune-mediated tissue damage and tumour cell

                                                                                                                                                                                                          Gaps
The peptide can be used for treating inflammation and immune-mediated tissue damage such as occurs in the course of autoimmune diseases, e.g. rheumatoid arthritis. It can also be used for determining metastatic potential or to treat or prevent tumor cell metastasis. This peptide corresponds to AA 150-180 of the CD44
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The peptide can be used for treating inflammation and immunemediated tissue damage such as occurs in the course of autoimmune diseases, e.g. rheumatoid arthritis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The fusion protein may be used to target proteoglycans to a given site, which causes local accumulation of GAG-binding proteins. Therefore the protein may be used as adjuvants for vaccination and in the targeting of chemokines to non-immunogenic tumour cells to enhance cellular antitumour responses. In addition, the fusion protein can also enhance the half-life
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  assembly sites in a CD44 exon.

The recombinant fusion protein may be administered to a patient to enhance the biological activity of a GAG-binding protein within the body. The protein also enhances wound healing and may be used to treat rheumatoid arthritis, asthma, chronic obstructive pulmonary disorder, Lupus, inflammatory bowel disease, psoriasis, osteoarthritis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acid construct comprising promoter, transcription factor gene, activation sequence and effector gene - useful for gene therapy treatment of allergies, inflammation, transplant disorders
                                                               epitope clone c86, which was isolated by screening a random DNase I digested Phl p I E. coli expressed lambda gill cDNA library, with serum IgE from Phl p I allergic patients. The epitope can be used to (pref. in vitro) diagnose allergy to plant proteins, esp. grass pollen, by immunoassay detection of specific antibodies, for the treatment of pollen allergy, by passive admin. Or active immunotherapy and for measuring (pref. in vitro) cellular reactions against the Phl p I epitope. The epitope is an immunodominant IgE hapten, and is therefore less likely to cause anaphylactic shock during hyposensitisation treatment.
                                                                                                                                                                                                                                                                                                                                                                    ö
                                                The present sequence is the Timothy grass allergen Phl p I

This invention describes (1) a protein that inhibits p27 and thereby arrests p27-induced inhibition of cell proliferation, (2) the protein of (1) comprising at least part of the amino acid sequence of murine p163. (3) a protein that can be derived from the protein of (2) by deletion of the p27 binding domain or the Ran binding domain, (4) a protein that can be derived from the protein of (2) by deletion of all amino acid sequences other than the p27 binding domain, (5) a protein that is the bind to the p17 binding domain, (5) a protein that is the human or other mammalian species homologue of a protein as in (1)-(4), (6) DNA encoding the p163 protein, (7) antibodies and antibody fragments that bind to the Ran binding domain of a protein as above, (9) antisense nucleic acids complementary to portions of the DNA of (6) between codons 121 and 467, (10) a nucleic acid construct coding for an antisense nucleic acid as in (9) for inhibiting the proliferation of a cell, in which DNA coding for the antisense nucleic acid as in (2) for the antisense uncleic acid sequence is linked to at least one activation sequence and is introduced into the target cell as naked DNA or as an insert in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

transcription of component (d) and (d) an effector gene. The construct, preferably in a plasmid or viral vector, or cell can be used to treat a disease selected from infections, tumours, leukaemia, autoimmune diseases, allergies, arthritis, inflammations, transplant rejection, graft-versus-host disease, blood clotting disorders, circulatory disorders, anammia, hormonal disorders and CNS injuries. This sequence represents a fragment of the Saccharomyces cerevisiae Nup2 protein which is used to describe the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ő
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New p27-inhibiting protein p163 and DNA - useful for detection and/or quantification of p163 \ensuremath{\mathtt{mRNA}}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score 39; DB 20; Length 24;

```
conviral or viral vector and (11) a nucleic acid construct containing the DNA of (6) linked to an activation sequence that permits expression of a protein as above in a cell. The DNA of (6) can be used for detection and/or quantification of p163 mRNA in cells and/or tissues, preferably by Northern blotting, PCR or fluorescent in-situ hybridisation. The proteins of an be used to produce antibodies, which can be used to detect the corresponding protein in cells, tissues or body fluids. The antisense nucleic acids can be used to inhibit cell proliferation in vitro or in vivo. The proteins can be used to screen for substances that inhibit the interaction between the proteins and their cellular binding partners, preferably using a two hybrid system or using an affinity system in which phase is incubated with a test substance, and the inhibition of the binding of a labelled binding partner of p163 (especially p27 or Ran) is measured. Assays for p163 can be used to assess the malignancy of
                                                                                                                                                                                                                                                                                                        ó

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to nucleic acid sequences (AAX22111 to AAX22134) encoding human secreted proteins (AAX01135 to AAX01158). The secreted protein gene sequences are deposited with the ATCC under deposit number ATCC 209118. Host cells comprising recombinant vectors containing the nucleic acid sequences are used for the recombinant production of the secreted proteins. The polynucleotide and amino acid sequences are useful for are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Pathological conditions can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; secreted protein; gene therapy; protein therapy; tissue; cancer; tumour; neurodegenerative disorder; leukaemia; autoimmune disease; AIDS; developmental abnormality; foetal deficiency; Alzheimer's disease; cognitive disorder; schizophrenia: immunological disorder; moder disorder; immune deficiency disease; respiratory disorder; arthritis; skeletal; haematopoietic disorder; neural; osteoporosis; metabolic disorders; cardiovascular; endocrine; gastrointestinal; asthma; diagnosis.
                               represent peptide derivatives given in examples from the present invention. The peptide derivatives have a thrombin recognition site binder mechanism of action. The peptide derivatives can be used as anticoagulants. They can bind to the thrombin recognition site without binding to the cleavage site of thrombin.
AAY53062 to AAY53093 represent specifically claimed anticoagulant peptide derivatives from the present invention. AAY53094 to AAY53125
                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated human genes and the secreted polypeptides they encode useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, immune deficiency diseases or blood

The polypeptides are also useful for identifying their binding partners. The present sequence represents a polypeptide fragment encoded by a gene of the invention (see descriptor
be also diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the polynucleotides, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, developmental abnormalities and foetal deficiencies, autoimmune diseases, lymphonas, Alzheiner's and cognitive disorders, schizophrenia, immunological disorders, immune deficiency diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Complementary peptide ligands as reagents and drugs for drug discovery programs and as lead ligands to facilitate drug design and development, are generated from microbial genome sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a set of complementary peptide ligands generated from Mycoplasma genitalium genome sequences. These specific complementary peptides interact with their relevant target proteins encoded by the microbial genome. They are capable of antagonising or agonising specific interaction of a protein with another protein or receptor and are thus useful as reagents and drugs, and as lead ligands to facilitate drug design and development. They are useful as tools for functional genomic studies, reagents for the configuration of high-throughput screens, as a starting point for
